# Assignment 6

## Title: Implementation of DES Algorithm.

## Introduction:

Data encryption standard (DES**)** has been found vulnerable to very powerful attacks and therefore, the popularity of DES has been found slightly on the decline. DES is a block cipher and encrypts data in blocks of size of **64 bits** each, which means 64 bits of plain text go as the input to DES, which produces 64 bits of ciphertext. The same algorithm and key are used for encryption and decryption, with minor differences. The key length is **56 bits**.

DES is based on the two fundamental attributes of cryptography: substitution (also called confusion) and transposition (also called diffusion). DES consists of 16 steps, each of which is called a round. Each round performs the steps of substitution and transposition. Let us now discuss the broad-level steps in DES.

- In the first step, the 64-bit plain text block is handed over to an initial Permutation (IP) function.
- The initial permutation is performed on plain text.
- Next, the initial permutation (IP) produces two halves of the permuted block; saying Left Plain Text (LPT) and Right Plain Text (RPT).
- Now each LPT and RPT go through 16 rounds of the encryption process.
- In the end, LPT and RPT are rejoined and a Final Permutation (FP) is performed on the combined block
- The result of this process produces 64-bit ciphertext.

## Code:

```
#include <bits/stdc++.h>

using namespace std;

string hex2bin(string s)

{

        unordered_map<char, string> mp;
```

```
        mp['0'] = "0000";
        mp['1'] = "0001";
        mp['2'] = "0010";
        mp['3'] = "0011";
        mp['4'] = "0100";
        mp['5'] = "0101";
        mp['6'] = "0110";
        mp['7'] = "0111";
        mp['8'] = "1000";
        mp['9'] = "1001";
        mp['A'] = "1010";
        mp['B'] = "1011";
        mp['C'] = "1100";
        mp['D'] = "1101";
        mp['E'] = "1110";
        mp['F'] = "1111";
        string bin = "";
        for (int i = 0; i < s.size(); i++) {
                bin += mp[s[i]];
        }
        return bin;
}
string bin2hex(string s)
{
        // binary to hexadecimal conversion
        unordered_map<string, string> mp;
        mp["0000"] = "0";
        mp["0001"] = "1";
        mp["0010"] = "2";
```

```
        mp["0011"] = "3";
        mp["0100"] = "4";
        mp["0101"] = "5";
        mp["0110"] = "6";
        mp["0111"] = "7";
        mp["1000"] = "8";
        mp["1001"] = "9";
        mp["1010"] = "A";
        mp["1011"] = "B";
        mp["1100"] = "C";
        mp["1101"] = "D";
        mp["1110"] = "E";
        mp["1111"] = "F";
        string hex = "";
        for (int i = 0; i < s.length(); i += 4) {
                string ch = "";
                ch += s[i];
                ch += s[i + 1];
                ch += s[i + 2];
                ch += s[i + 3];
                hex += mp[ch];
        }
        return hex;
}
